- 1. All poets have low self-esteem.
- 2. Some dean danced nude on the table.
- 3. At least 3 grad students prepared presentations.
- 4. An even number of the students saw a ghost.
- 5. Most of the students think they are smart.
- 6. Less than half of the students received good marks.
- 7. Many of the soldiers have not eaten for several days.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

8. A few of the conservatives complained about taxes.

## **Determiners**

#### Definition

Expressions that appear to be descriptions of quantity.

### Example

All, not quite all, nearly all, an awful lot, a lot, a comfortable majority, most, many, more than n, less than n, quite a few, quite a lot, several, not a lot, not many, only a few, few, a few, hardly any, one, two, three.

## Quantifiers are second-order relations

#### Observation

If we fix a model  $\mathbb{M} = (M, A^M, B^M)$ , then we can treat a generalized quantifier as a relation between relations over the universe.

Example

 $\mathsf{every}[A,B] = 1 \; \mathrm{iff} \; A^M \subseteq B^M$ 

## Quantifiers are second-order relations

#### Observation

If we fix a model  $\mathbb{M} = (M, A^M, B^M)$ , then we can treat a generalized quantifier as a relation between relations over the universe.

Example

every[A, B] = 1 iff  $A^M \subseteq B^M$ 

even[A, B] = 1 iff card( $A^M \cap B^M$ ) is even

## Quantifiers are second-order relations

#### Observation

If we fix a model  $\mathbb{M} = (M, A^M, B^M)$ , then we can treat a generalized quantifier as a relation between relations over the universe.

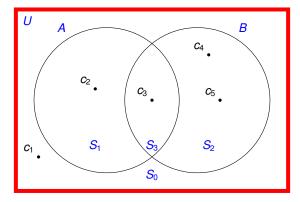

Example

$$every[A, B] = 1$$
 iff  $A^M \subseteq B^M$ 

even[A, B] = 1 iff card( $A^M \cap B^M$ ) is even

most[A, B] = 1 iff  $card(A^M \cap B^M) > card(A^M - B^M)$

# **Generalized Quantifiers**

#### Definition

A quantifier Q is a way of associating with each set M a function from pairs of subsets of M into  $\{0, 1\}$  (False, True).

### Example

 $every_M[A, B] = 1 \text{ iff } A \subseteq B$ 

#### Definition

A quantifier Q is a way of associating with each set M a function from pairs of subsets of M into  $\{0, 1\}$  (False, True).

Example

 $every_M[A, B] = 1$  iff  $A \subseteq B$ 

 $even_M[A, B] = 1$  iff  $card(A \cap B)$  is even

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

#### Definition

A quantifier Q is a way of associating with each set M a function from pairs of subsets of M into  $\{0, 1\}$  (False, True).

Example

 $every_M[A, B] = 1$  iff  $A \subseteq B$ 

 $even_M[A, B] = 1$  iff  $card(A \cap B)$  is even

 $most_M[A, B] = 1$  iff  $card(A \cap B) > card(A - B)$ 

# Space of GQs

• If card(M) = n, then there are  $2^{2^{2n}}$  GQs.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

For n = 2 it gives 65,536 possibilities.

# Space of GQs

- If card(M) = n, then there are  $2^{2^{2n}}$  GQs.
- For n = 2 it gives 65,536 possibilities.

#### Question Which of those correspond to simple determiners?

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

# Definability

#### Definition

Let Q be a generalized quantifier and  $\mathcal{L}$  a logic. We say that the quantifier Q is *definable* in  $\mathcal{L}$  if there is a sentence  $\varphi \in \mathcal{L}$  such that for any  $\mathbb{M}$ :

 $\mathbb{M} \models \varphi \text{ iff } \mathsf{Q}_{\mathsf{M}}[\mathsf{A}, \mathsf{B}].$ 

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

Some GQs, like  $\exists^{\leq 3},\,\exists^{=3},$  and  $\exists^{\geq 3},$  are expressible in FO. Example

some  $x [A(x), B(x)] \iff \exists x [A(x) \land B(x)].$ 

# Non-elementary GQs

#### Theorem

The quantifiers 'there exists (in)finitely many', most and even are not first-order definable.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

# Non-elementary GQs

#### Theorem

The quantifiers 'there exists (in)finitely many', most and even are not first-order definable.

We can use higher-order logics:

# Non-elementary GQs

#### Theorem

The quantifiers 'there exists (in)finitely many', most and even are not first-order definable.

We can use higher-order logics:

Example In  $\mathbb{M} = (M, A^M, B^M)$  the sentence

most x [A(x), B(x)]

is true if and only if the following condition holds:

 $\exists f: (A^M - B^M) \longrightarrow (A^M \cap B^M)$  such that f is injective but not surjective.

• Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .

- Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .
- A word (string) is a finite sequence of symbols from a given alphabet, e.g., "1110001110".

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

- Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .
- A word (string) is a finite sequence of symbols from a given alphabet, e.g., "1110001110".

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

• The *empty word*,  $\varepsilon$ , is a sequence without symbols.

- Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .
- A word (string) is a finite sequence of symbols from a given alphabet, e.g., "1110001110".

- The *empty word*,  $\varepsilon$ , is a sequence without symbols.
- The length of a word is the number of symbols in it.

- Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .
- A word (string) is a finite sequence of symbols from a given alphabet, e.g., "1110001110".

- The *empty word*,  $\varepsilon$ , is a sequence without symbols.
- The length of a word is the number of symbols in it.
- The set of all words over alphabet Γ is denoted by Γ\*, e.g., {0,1}\* = {ε, 0, 1, 00, 01, 10, 11, 000, ...}.

- Alphabet is any non-empty finite set of symbols, e.g.,  $A = \{a, b\}$  and  $B = \{0, 1\}$ .
- A word (string) is a finite sequence of symbols from a given alphabet, e.g., "1110001110".

- The *empty word*,  $\varepsilon$ , is a sequence without symbols.
- The length of a word is the number of symbols in it.
- The set of all words over alphabet Γ is denoted by Γ\*, e.g., {0,1}\* = {ε, 0, 1, 00, 01, 10, 11, 000, ...}.
- Any set of words, a subset of Γ\*, will be called a *language*.

#### Finite automata

#### Definition

A non-deterministic finite automaton (FA) is a tuple  $(A, Q, q_s, F, \delta)$ , where:

- A is an input alphabet;
- Q is a finite set of states;
- $q_s \in Q$  is an initial state;
- F ⊆ Q is a set of accepting states;
- $\delta : Q \times A \longrightarrow \mathcal{P}(Q)$  is a transition function.

#### Definition

The language accepted (recognized) by some FA H, L(H), is the set of all words over the alphabet A which are accepted by H.

#### Definition

We say that a *language*  $L \subseteq A^*$  *is regular* if and only if there exists some FA *H* such that L = L(H).

Let  $A = \{a, b\}$  and consider the language  $L_1 = A^*$ .

# Example 2

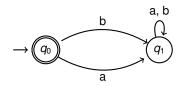

Let  $L_2 = \emptyset$ 

Example 3

 $L_3 = \{\varepsilon\}$ 

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Not every language is regular

$$L_{ab} = \{a^n b^n : n \ge 1\}$$

## Push down automata

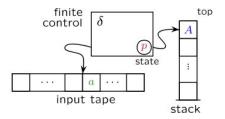

#### Definition

A non-deterministic push-down automaton (PDA) is a tuple (A,  $\Gamma$ , #, Q,  $q_s$ , F,  $\delta$ ), where:

▲□▶▲□▶▲□▶▲□▶ □ のQ@

- A is an input alphabet;
- Γ is a stack alphabet;
- $\# \notin \Gamma$  is a stack initial symbol, empty stack consists only from it;
- Q is a finite set of states;
- $q_s \in Q$  is an initial state;
- F ⊆ Q is a set of accepting states;
- $\delta: Q \times (A \cup \{\varepsilon\}) \times \Gamma \longrightarrow \mathcal{P}(Q \times \Gamma^*)$  is a transition function.

# PDA

push/pop-off a symbol from the top of the stack

#### Context-free languages

#### Definition

We say that a language  $L \subseteq A^*$  is context-free if and only if there is a PDA H such that L = L(H).

#### $Regular \subset context-free$

There is a PDA for  $L_{ab} = \{a^n b^n : n \ge 1\}$ .

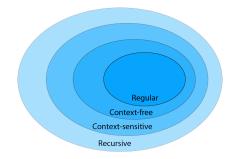

#### Beyond context-free languages

$$L_{abc} = \{a^k b^k c^k : k \ge 1\}$$

We will investigate stronger languages in the last lecture.

#### Definition

If in the above definition for all *i*:  $n_i = 1$ , then we say that a quantifier is *monadic*, otherwise we call it *polyadic*.

 $\begin{aligned} \mathsf{W} &= \{(M,R) \mid R \subseteq M^2 \& R \text{ is a well-order}\}. \\ \mathsf{Ram} &= \{(M,A,R) \mid A \subseteq M, R \subseteq M^2 \& \forall a, b \in A \ R(a,b)\}. \end{aligned}$ 

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

## Coding

### Definition

Let  $\tau = \{R_1, \ldots, R_k\}$  be a relational vocabulary and  $\mathbb{M} a \tau$ -model of the following form:  $\mathbb{M} = (U, R_1^M, \ldots, R_k^M)$ , where  $U = \{1, \ldots, n\}$  is the universe of model  $\mathbb{M}$  and  $R_i^M \subseteq U^{n_i}$  is an  $n_i$ -ary relation over U, for  $1 \le i \le k$ . We define a *binary encoding for*  $\tau$ -models. The code for  $\mathbb{M}$  is a word over  $\{0, 1, \#\}$  of length  $O((\operatorname{card}(U))^c)$ , where c is the maximal arity of the predicates in  $\tau$  (or c = 1 if there are no predicates). The code has the following form:

$$\tilde{n} \# \tilde{R}_1^M \# \dots \# \tilde{R}_n^M$$
, where:

- ñ is the part coding the universe of the model and consists of n 1s.
- $\vec{R}_i^M$  the code for the  $n_i$ -ary relation  $\vec{R}_i^M$  is an  $n^{n_i}$ -bit string whose *j*-th bit is 1 iff the *j*-th tuple in  $U^{n_i}$  (ordered lexicographically) is in  $\vec{R}_i^M$ .

# is a separating symbol.

## Coding Example

Consider vocabulary  $\sigma = \{P, R\}$ , where *P* is a unary predicate and *R* a binary relation. Take the  $\sigma$ -model  $\mathbb{M} = (M, P^M, R^M)$ , where the universe  $M = \{1, 2, 3\}$ , the unary relation  $P^M \subseteq M$  is equal to  $\{2\}$  and the binary relation  $R^M \subseteq M^2$  consists of the pairs (2, 2) and (3, 2).

- ñ consists of three 1s as there are three elements in M.
- $\tilde{P^M}$  is the string of length three with 1s in places corresponding to the elements from *M* belonging to  $P^M$ . Hence  $\tilde{P^M} = 010$  as  $P^M = \{2\}$ .
- $\vec{R^M}$  is obtained by writing down all  $3^2 = 9$  binary strings of elements from *M* in lexicographical order and substituting 1 in places corresponding to the pairs belonging to  $R^M$  and 0 in all other places. As a result  $\vec{R^M} = 000010010$ .

(日) (日) (日) (日) (日) (日) (日)

Adding all together the code for  $\mathbb{M}$  is 111#010#000010010.

## Iteration

- 1. Most logicians criticized some papers.
- 2. It(most, some)[Logicians, Papers, Criticized].

#### Definition

Let Q and Q' be generalized quantifiers of type (1, 1). Let A, B be subsets of the universe and R a binary relation over the universe. Suppressing the universe, we will define the *iteration* operator as follows:

 $\mathsf{lt}(\mathsf{Q},\mathsf{Q}')[A,B,R] \iff \mathsf{Q}[A,\{a \mid \mathsf{Q}'[B,R_{(a)}]\}],$ 

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

where  $R_{(a)} = \{ b \mid R(a, b) \}.$ 

# Illustration

Most girls and most boys hate each other.

#### Theorem (Steinert-Threlkeld & Icard)

Let Q and Q' be computable by DFA (PDA), then It(Q,Q') is also DFA (PDA) computable.

## Cumulation

Eighty professors taught sixty courses at ESSLLI'08.

 $\begin{array}{l} \text{Definition} \\ \text{Cum}(\text{Q},\text{Q}')[\textit{A},\textit{B},\textit{R}] \iff \end{array}$ 

 $It(Q, some)[A, B, R] \land It(Q', some)[B, A, R^{-1}]$ 

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

# Illustration

Most girls and most boys hate each other.

## Possibly branching sentences

- 1. Most villagers and most townsmen hate each other.
- 2. One third of villagers and half of townsmen hate each other.

(ロ)、

3. 5 villagers and 7 townsmen hate each other.

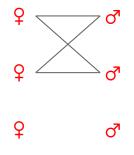

#### Most girls and most boys hate each other.

$$\begin{array}{l} \text{most } x : G(x) \\ \text{most } y : B(y) \end{array} H(x, y). \end{array}$$

 $\exists A \exists A' [\mathsf{most}(G, A) \land \mathsf{most}(B, A') \land \forall x \in A \ \forall y \in A' \ H(x, y)].$ 

# Illustration

Most girls and most boys hate each other.

## Definition

#### Definition

Let Q and Q' be both MON $\uparrow$  quantifiers of type (1, 1). Define the *branching* of quantifier symbols Q and Q' as the type (1, 1, 2) quantifier symbol Br(Q, Q'). A structure  $\mathbb{M} = (M, A, B, R) \in Br(Q, Q')$  if the following holds:

 $\exists X \subseteq A \exists Y \subseteq B[(X, A) \in Q \land (Y, B) \in Q' \land X \times Y \subseteq R].$ 

< □ > < 同 > < Ξ > < Ξ > < Ξ > < Ξ < </p>

Branching readings are intractable

Theorem Proportional branching sentences are NP-complete.

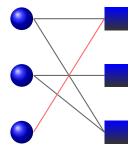

# Two-way quantification

 $\text{It}(\mathsf{Q}_1,\mathsf{Q}_2)\wedge\text{It}(\mathsf{Q}_2,\mathsf{Q}_1)$ 

# Two-way quantification

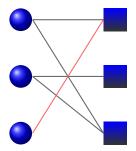

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

## Two-way quantification

#### $\text{It}(\mathsf{Q}_1,\mathsf{Q}_2)\wedge\text{It}(\mathsf{Q}_2,\mathsf{Q}_1)$

Subjects are happy to accept such interpretation.

Gierasimczuk & Szymanik, Branching Quantification vs. Two-way Quantification, Journal of Semantics, 2009

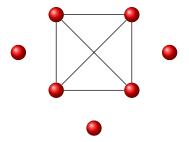

## Potentially strong reciprocal sentences

1. Andi, Jarmo and Jakub laughed at one another.

- 2. 15 men are hitting one another.
- 3. Most of the PMs refer to each other.

# Strong reading

Most of the PMs refer to each other.

#### Definition

Let Q be a right monotone increasing quantifier of type (1, 1). We define:

$$\mathsf{Ram}_{\mathsf{S}}(\mathsf{Q})[A, R] \iff \exists X \subseteq A[\mathsf{Q}(A, X) \land \forall x, y \in X(x \neq y \implies R(x, y))].$$

Most Boston pitchers sat alongside each other.

#### Definition

 $\begin{aligned} \mathsf{Ram}_{\mathsf{I}}(\mathsf{Q})[A, R] &\iff \exists X \subseteq A[\mathsf{Q}(A, X) \\ \land \forall x, y \in X (x \neq y \implies \exists \text{ sequence } z_1, \dots, z_\ell \in X \text{ such that} \\ (z_1 = x \land R(z_1, z_2) \land \dots \land R(z_{\ell-1}, z_\ell) \land z_\ell = y)]. \end{aligned}$ 

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ◆ □ ◆ ○ ◆ ○ ◆

Some pirates were staring at each other in surprise.

#### Definition

 $\mathsf{Ram}_{\mathsf{W}}(\mathsf{Q})[A, R] \iff \exists X \subseteq A[\mathsf{Q}(A, X) \land \forall x \in X \exists y \in X (x \neq y \land R(x, y))].$

## **Neutral Modifier**

### Definition (van der Does 1992)

Let *U* be a universe,  $X \subseteq U$ ,  $Y \subseteq \mathcal{P}(U)$ , and Q a type (1, 1) quantifier. We define the *neutral modifier*:

$$Q^{N}[X, Y]$$
 is true  $\iff Q[X, \bigcup (Y \cap \mathcal{P}(X))].$ 

# Monotonicity preservation under $(\cdot)^N$

### Fact (Ben-Avi and Winter 2003)

Let Q be a distributive determiner. If Q belongs to one of the classes  $\uparrow MON \uparrow$ ,  $\downarrow MON \downarrow$ ,  $MON \downarrow$ ,  $MON \downarrow$ , then the collective determiner Q<sup>N</sup> belongs to the same class. Moreover, if Q is conservative and  $\sim MON$  ( $MON \sim$ ), then Q<sup>N</sup> is also  $\sim MON$  ( $MON \sim$ ).

(ロ) (同) (三) (三) (三) (○) (○)

# What about split groups?

(1.) Exactly 5 students drank a whole keg of beer together.

# What about split groups?

(1.) Exactly 5 students drank a whole keg of beer together. (1'.)  $(\exists^{=5})^{N}$ [Student, Drink-a-whole-keg-of-beer].

- (3.) Some students played poker together.
- (3'.) some<sup>EM</sup> x, X[Student(x), Play(X)].

### Definition

We take five<sup>*EM*</sup> to be the second-order quantifier denoting:

 $\{(M, P, G) \mid P \subseteq M; G \subseteq \mathcal{P}(M) : \exists Y \subseteq P(\operatorname{card}(Y) = 5 \& P \in G)\}.$

# SO-definable GQs are closed on lifts

Theorem Let Q be a Lindström quantifier definable in SO. Then the collective quantifiers  $Q^{EM}$ ,  $Q^N$ , and  $Q^{dfit}$  are definable in SO.

◆□ > ◆□ > ◆豆 > ◆豆 > ̄豆 \_ のへで

### Theorem

Let Q be a Lindström quantifier definable in SO. Then the collective quantifiers  $Q^{EM}$ ,  $Q^N$ , and  $Q^{dfit}$  are definable in SO.

### Proof.

Let us consider the case of  $Q^{EM}$ . Let  $\psi(x)$  and  $\phi(Y)$  be formulas. We want to express  $Q^{EM}x$ ,  $Y(\psi(x), \phi(Y))$  in second-order logic. By the assumption, the quantifier Q can be defined by some sentence  $\theta \in SO[\{P_1, P_2\}]$ . We can now use the following formula:

$$\exists Z(\forall x(Z(x) \to \psi(x)) \land (\theta(P_1/\psi(x), P_2/Z) \land \phi(Y/Z)).$$

(ロ) (同) (三) (三) (三) (三) (○) (○)

# And this is the case for all SO-definable lifts

#### Theorem

Let us assume that the lift  $(\cdot)^*$  and a Lindström quantifier Q are both definable in second-order logic. Then the collective quantifier Q<sup>\*</sup> is also definable in second-order logic.

# Some collectives are not definable in SO

# Theorem (Kontinen and Szymanik 2012)

The quantifier MOST is not definable in second-order logic.

### Proof.

By translating into FO(+, x) over cardinalities  $2^n$  and using Ajtai's 1983 results.

▲□▶▲□▶▲□▶▲□▶ □ のQ@

### Consequences

### Corollary

The type-shifting strategy is not general enough to cover all collective quantification in natural language.

What is the right ontology for semantics?

L\* and SO doesn't capture natural language?

# What is the right ontology for semantics?

- L\* and SO doesn't capture natural language?
- Are many-sorted (algebraic) models more plausible?
  - Type-shifting is too complex;
  - In principle this question is psychologically testable.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

# $\Sigma_1^1$ (Ristad's)-thesis

### **Hypothesis**

Our everyday language is semantically bounded by the properties expressible in the existential fragment of second-order logic.

- Does SOGQ "MOST" belong to everyday language?
  - Everyday language doesn't realize prop. coll. qua.
  - No need to extend the higher-order approach to prop. qua.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ の < @

- Does SOGQ "MOST" belong to everyday language?
  - Everyday language doesn't realize prop. coll. qua.
  - No need to extend the higher-order approach to prop. qua.

# Question

Have we just encountered an example where complexity restricts the expressibility of everyday language as suggested by  $\Sigma_1^1$ -thesis?
